

Sensory Processing patterns in women with Attention Deficit Hyperactivity Disorder

Authors: **Aniesa Blore** & Orlagh Daly ✉ Aniesa@sensationalkids.co.uk
 Employer: Sensational Kids & Ulster University

Introduction

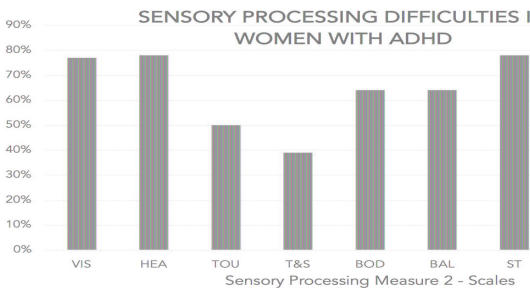

The primary aim of this study was to determine the nature of sensory processing challenges in women diagnosed with ADHD after the age of 21.

Methodology

Participants were recruited via Facebook. Each participant completed an on-line SPM-2 Adult questionnaire.

Conclusions

Further research into praxis is needed to ascertain which problems - ideation or motor planning - have a greater impact on function and participation in women with ADHD. The Evaluation of Ayres Sensory Integration (EASI) may be a tool able to discern sensory processing patterns in women with ADHD.

Results

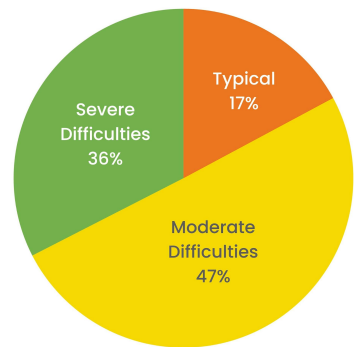

78% of women show overall Moderate to Severe difficulties

Sensory Total T-scores

32% of women show Moderate to Severe Difficulties with Planning and Ideas

Planning and Ideas T-scores
